*The T Series MGs, starting with the TA introduced in 1936, represents the absolute archetype of the British sports car. These cars provide the authentic experience of sports car driving: the snug two-seater cockpit, quick steering, firm suspension, flat cornering, snappy gearchange and lively engine. *The first Rolls-Royce armoured car was a privately owned vehicle fitted with a machine-gun and a limited amount of armour plate, used by the Royal Naval Air Service in Flanders in 1914. By 1915, nearly 100 had been built and turned over to the Army. From then on, as Sir Albert Stern said 'They searched the world for war', operating as far apart as the northwest frontier of India, the Middle East and southern Africa. The cars were fast, quiet and reliable but above all powerful. 'A Rolls in the desert is above rubies,' said Lawrence of Arabia. After World War I, the War Office continued to produce the Rolls-Royce while tinkering with the design. These further cars served all across the Empire, including in Ireland and even later Shanghai, returning for a final brief appearance in the early stages of World War II.This book tells the complete story of the Rolls-Royce Armoured Car, following its design and development as it fought from theatre to theatre during World War I and the turbulent inter-war years.*

The T Series MGs TA, TB, TC, TD and TF evoke the living spirit of traditional sports car motoring. All five models are illustrated in superb detail, supported by an authoritative text aimed at helping owners get their cars right. The TA and TB Tickford Drophead Coupmodels and the rare Arnolt-MG are included.

This Floyd Clymer publication focuses on the post-war (1945-1955) TC, TD and TF series which accounted for 94% of the total production run of all T series MG’s. It’s a logical association of those models due to the similarity and, in many cases, the identical nature of their mechanical (and electrical) components and assemblies.

*The subject of 'Intrinsically Conducting Polymers: an Emerging Technology' was addressed at the NATO Advanced Research Workshop held in Burlington, Vermont, U.S.A. in October 1992. Approximately 30 invited scientists from 11 different countries attended the workshop and 24 lectures were given discussing in detail the most important processing techniques and applications of conducting polymers, along with the basic materials science aspects. The results was the present book, which, for the first time, addresses progress in materials science related to polymers presently on the market and to already existing applications, as well as to future applications. This book covers mostly existing and future applications of intrinsically conducting polymers. Among these applications are the redox-type, such as batteries and electrochemical actuators and artificial muscles. Capacitors, microlithography and transistor uses are addressed. The use of conducting polymers as 'smart' materials in sensor/indicator types of applications is discussed. ESD applications and EMI shielding are subjects that conducting polymers are sought after for. Microwave properties for radar/microwave absorption and for plastics joining/welding are discussed. Also, this book discusses materials processing for the various applications, including fabrication of fibers, textiles, colloids and films/coatings. This book will be an important addition to the libraries of every institution involved in this emerging technology.*
